

# Dividing with Remainders

When you divide, you can think of putting items into groups.  
For example:

Sometimes there are items left over. In division, the number of leftover items is called the **remainder**. For example:

Divide. You may use counters or pictures to help.

1.  $4 \overline{)34}$

2.  $8 \overline{)65}$

3.  $9 \overline{)75}$

4.  $6 \overline{)28}$

5.  $5 \overline{)14}$

6.  $9 \overline{)37}$

7. **Number Sense** In division, why should the remainder not be greater than the divisor?
